

Begonia tuberhybrida **Nonstop[®] Joy Mocca White**

Culture guide

Uses:

Pots, Hanging Baskets, Mixed Containers and Landscape

Exposure:

Partial shade - Sun

Garden height:

10" / 25 cm

Sowing method:

Sow 1-2 seeds or pellets per plug.

Germination:

Optimum conditions for seedling development, beginning on the day of sowing until radicle emergence. Expect radicle emergence in 7-10 days.

Temperature:

72-74 °F (22-23)

Fertilization:

Begin fertilizing early once germination is complete, approximately day 14. Lower rates of feeding at 50 ppm 2-3 times per week will help to size up the seedlings. Under higher light conditions use a 20-10-20 fertilizer and under lower light a 17-5-17. Once seedlings are established the 17-5-17 fertilizer works well. Include a micro nutrient package to give adequate supply of minor elements.
